In all cases we also consider DHW heating for 4 people with a consumption of 40 l/person/day. The input data for the heat pump design must be based on a calculation. Energy needs for space and DHW heating can be found in the Energy Performance Certificate of the building, or determined according to EN ISO 13 790 or EN ISO 52 016-1. The heat loss is usually stated in the technical report of the heating design, or it can be determined according to EN 12 831-1.

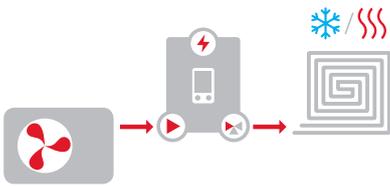

If there is another significant appliance present in the building heated by a heat pump (swimming pool, ventilation...) which is not included in the above calculations, contact us via email [sales@regulus.eu](mailto:sales@regulus.eu)

We offer heat pumps in complete sets with all accessories, including indoor units and multi-energy thermal stores equipped with controllers, thermal stores and hot water storage tanks, or combination thermal stores - HSK and DUO models. For inverter heat pumps which can be installed without increasing the volume of the heating system (thermal store), the installation conditions specified in the instructions must be observed. Our sales representatives will advise you on the design of the heat pump and the selection of accessories.
